Introduction

The KIT-PLASMEBA project

Framework of development of LoKI

- ▶ The **LoKI** tool is being developed in the framework of the **KIT-PLASMEBA** (Kinetic Testbed for PLASMa Environmental and Biological Applications) project.

KIT-PLASMEBA

- ▶ aims constructing an **open-source kinetic code** for N_2 - O_2 mixtures (in presence also of rare gases)
- ▶ providing the combined **chemical and transport** description of plasma **charged / neutral species**, both in **volume and surface phases**
- ▶ **user-defined mixture compositions**, pressure, radial dimension and excitation conditions.

POST-DOC

A. Tejero-Del-Caz
- Main developer
of LoKI
(LoKI-B+LoKI-C)

STUDENTS

D. Gonçalves
- Ionization and
e-e collisions
(LoKI-B)

A. Silva
- O₂/O kinetics
(LoKI-C)

S. Jacob
- N₂/N kinetics
(LoKI-C)

D. Nina
- Draft version of
LoKI-C

LoKI

- ▶ The LisbOn Knetics (LoKI) is a simulation tool for **low-temperature plasmas**.
- ▶ It comprises two modules describing the **electron kinetics** and the **ions/neutrals kinetics**.

LoKI-B (open-source)

- ▶ Solves the **electron Boltzmann equation**
- ▶ Evaluates a **prescribed electron energy distribution function**

LoKI-C

- ▶ Solves a **system of zero dimensional rate balance equations** for the heavy particles, **including transport effects**

LoKI-B module

Introduction

KIT-PLASMEBA

LoKI

The code

How to use the code?

The benchmarks

Atomic gas: He

Molecular gas: N₂

Approximations

- ▶ Non magnetised plasmas
- ▶ classical two-term expansion
- ▶ homogeneity¹
- ▶ stationarity¹
- ▶ no space-charge separation

Operators

- ▶ inelastic direct/stepwise and superelastic collision mechanisms with all types of excited states
- ▶ continuous approximation for rotations with Chapman-Cowling correction (CC-CAR)
- ▶ electron-electron collisions
- ▶ non-conservative ionizations

¹Except when considering a spatial / temporal growth due to ionization

LoKI-B module

Software characteristics

The LisOn KInetics
computational tool

L.L. Alves

Introduction

KIT-PLASMEBA

LoKI

The code

How to use the code?

The benchmarks

Atomic gas: He

Molecular gas: N₂

Code characteristics

- ▶ developed under **Matlab** following an **Object-Oriented** design
- ▶ **no hardcoded data** (except for fundamental constants)
- ▶ **user and developer friendly** (easy to use / maintain / upgrade)
- ▶ handles **flexible mixtures** of gases / excited states

History / Status / Roadmap

- ▶ First **closed beta** version of LoKI-B was released **early 2017**
(current version **LoKI-B_v0.6.3**)
- ▶ **Validation & Verification** of the tool are currently being carried out
- ▶ Production version and **public release** of the tool is expected by **late 2018**

The code

The code

How to use the code?

The benchmarks

Atomic gas: He
Molecular gas: N₂

Requirements

- ▶ A PC with Matlab installed (minimum version R2015b)

How to use it?

- ▶ Open Matlab and navigate to the LoKI-B source folder:

```
>> cd Develop/loki/Code
```
- ▶ Issue the command:

```
>> loki('setup_file.in')
```
- ▶ The main User Interface (UI) is the “**setup file**”.

The question is: **How to configure the setup file?**

The “setup file” at a glance

Structure of the setup file

The setup file

- ▶ Located in the Input folder
- ▶ Plain text file (“.in” extension just for organisation purposes)
- ▶ Comment character: %
- ▶ Indentation structured blocks
- ▶ Five sections:
 - ▶ workingConditions
 - ▶ electronKinetics
 - ▶ chemistry
 - ▶ gui
 - ▶ output

NOTE: a full GUI is on the roadmap. Right now the GUI is only for output purposes.

Information provided / selected by the user

The user must provide three types of information

- ▶ Information about **physical parameters**
 - ▶ working conditions
 - ▶ collisional data (<http://www.lxcat.net>)
 - ▶ atomic and molecular data
 - ▶ species populations
- ▶ Information about **physical models**
 - ▶ e-e collisions
 - ▶ electron density growth model
 - ▶ energy sharing mode in ionization collisions
- ▶ Information about **numerical details**
 - ▶ energy grid

How to use the code?

The benchmarks

Atomic gas: He
Molecular gas: N₂

Parameter	Expression
Reduced free diffusion coefficient	$D_e N = \frac{2e}{3m_e} \int_0^\infty \frac{u^{3/2}}{\nu_c/N} f(u) du$
Reduced mobility	$\mu_e N = -\frac{2e}{3m_e} \int_0^\infty \frac{u^{3/2}}{\nu_c/N} \frac{df(u)}{du} du$
Electron drift velocity	$v_d = \mu_e E$
Characteristic energy	$u_{\text{Char}} = \frac{D_e}{\mu_e}$
Mean energy	$\varepsilon = \int_0^\infty u^{3/2} f(u) du$
Electron “temperature”	$T_e = \frac{2}{3} \varepsilon$
Electron impact rate coefficients	$C_{i,j} = \sqrt{\frac{2e}{m_e}} \int_0^\infty \sigma_{i,j} u f(u) du$
Reduced Townsend coefficient	$\frac{\alpha}{N} = \frac{C_I}{v_d}$
